

Information about the Lecture

Engineering Mechanics II

Fig.: Joint bolt (left); Shear stresses (right) [1]

Content of the lecture

At the beginning of the term, elementary bending, torsion and shear theories of the straight beam will be discussed. Thereafter follows an introduction to the three-dimensional theory of elasticity. Hereby, it will be especially focused on multiaxial stress and strain states and Hooke's law which will be followed up by a depiction of energy methods and the approximation procedures of elastostatics. The lectures conclude with a discussion of the stability of elastic structures.

Dates, exam, lecture notes

Lecture dates	Tue., 11:30-13:00, Kleiner HS Bauingenieure, bldg 10.50 Wed., 11:30-13:00, Redtenbacher HS, bldg 10.91
First lecture	Tue., 16.04.2024
Tutorial	Fri., 09:45-11:15, Grashof HS, bldg 10.91
First tutorial	Fri., 19.04.2024
Lecture notes	available at Skriptenverkauf, Studentenhaus, Adenauerring 7
Contact	Dr.-Ing. Tom-Alexander Langhoff, M.Sc. Johannes Gisy
Course material	available under ILIAS, subscription from 11.04. on

Content of the lectures

- **Beam bending**
Bernoulli hypotheses; straight and unsymmetric bending of the straight beam; strains and stresses in the beam; moments of inertia of area; principle axes; technical bending theory; statically indeterminate problems; notch effect
- **Theory of torsion**
Circular cross sections; thin-walled closed cross sections; thin-walled open cross sections; shear stress distribution; shear flow; twisting; polar moment of inertia of area; section modulus; notch effect
- **Shear force**
Timoshenko-beam; estimation of the shear deformation and shear strain in the beam as a result of shear forces, statistical moment of an area; shear center
- **Three-dimensional stress and strain measures**
Normal and shear stresses, stress tensor; principal stresses and their directions; effective stresses; normal and shear strains; strain tensor; principal strains and their directions; effective strains; strain measurement
- **The three-dimensional Hooke's law**
Elastic and inelastic material behaviour; isotropy and anisotropy; elasticity and hyperelasticity; linear and nonlinear elastic material behaviour; Hooke's law; strain energy; complementary energy; stress theories
- **Basic equations of the three-dimensional elastostatics**
Distributed forces and resulting forces; Gauss theorem; global and local equilibrium conditions; differential equation for displacements of linear elastostatic; stress and displacement boundary conditions
- **Energy methods of elastostatics**
Theorems of Maxwell and Betti; theorems of Castigliano; principle of virtual displacements; principle of virtual forces
- **Approximation methods**
Method of Ritz and Galerkin; introduction to the Finite-Element-method
- **Stability of elastic bars**
Introduction to the theory of stability; bifurcation points; Euler's buckling theory
